Overview

The Landmarks app lets people explore interesting sites around the world. Whether it's a national park near their home or a far-flung location on a different continent, the app provides a way for people to organize and mark their adventures and receive custom activity badges along the way.

This sample demonstrates how to extend horizontal scrolling under a sidebar or inspector. Within each continent section in `LandmarksView`, an instance of `LandmarkHorizontalListView` shows a horizontally scrolling list of landmark views. When open, the landmark views can scroll underneath the sidebar or inspector.

Configure the scroll view

To achieve this effect, the sample configures the `LandmarkHorizontalListView` so it touches the leading and trailing edges. When a scroll view touches the sidebar or inspector, the system automatically adjusts it to scroll under the sidebar or inspector and then off the edge of the screen.

The sample adds a `Spacer` at the beginning of the `ScrollView` to inset the content so it aligns with the title padding:

```
ScrollView(.horizontal, showsIndicators: false) {
    LazyHStack(spacing: Constants.standardPadding) {
        Spacer()
            .frame(width: Constants.standardPadding)
        ForEach(landmarkList) { landmark in
            //...
        }
    }
}
```
